<td>13. Del Grande F, Aro M, Farahani SJ, Wilekens J, Cosgarea A, Carrino JA. Three-Tesla MR imaging of the elbow in non-symptomatic professional baseball pitchers. <em>Skeletal Radiol.</em> 2015;44(1):115-123.</td>
<td>Review/Other-Dx</td>
<td>21 professional non-symptomatic baseball pitchers</td>
<td>To retrospectively evaluate the qualitative and quantitative 3-T MRI features of the elbow in non-symptomatic professional baseball pitchers presenting as major league draft picks or trades.</td>
<td>Collateral ligament thickening was seen in a high proportion, nearly half; however, without features of full thickness tearing. Tendinosis without tearing was seen in 19% (4/21) of common extensors. Cartilage abnormalities were infrequent. Bone abnormalities manifested as edema in 24% (5/21) and humeroulnar osteophytosis. Ulnar nerve signal and/or morphologic abnormalities were seen in a very high proportion, up to 81% (17/21). The olceranon fat pad showed scarring features in about one third. The median ligament thicknesses in mm measured: 4.6 UCL anterior bundle, 1.8 UCL posterior bundle, 1.9 radial collateral ligament, 2.5 lateral UCL, and 0.7 mm annular. The median plica dimensions were 5.3 by 2.2 by 2.7 mm.</td>

<td>14. Taljanovic MS, Hunter TB, Fitzpatrick KA, Krupinski EA, Pope TL. Musculoskeletal magnetic resonance imaging: importance of radiography. <em>Skeletal Radiol.</em> 2003;32(7):403-411.</td>
<td>Observational-Dx</td>
<td>1,030 musculoskeletal MRI studies were performed in 1,002 patients</td>
<td>To determine the usefulness of radiography for interpretation of musculoskeletal MRI studies.</td>
<td>Radiographs were essential, very important or added information in 61%–75% of all musculoskeletal MRI cases. Radiographs were judged as essential for reading of MRI studies more often for trauma, infection/inflammation and tumors than for degenerative and miscellaneous/normal diagnoses (chi(2)=60.95, df=16, P&lt;0.0001). The clinical information was rated as “essential” or “useful” significantly more often than not (chi(2)=93.07, df=16, P&lt;0.0001). The clinical and MRI diagnoses were the same or partially concordant significantly more often for tumors than for trauma, infection/inflammation and degenerative conditions, while in the miscellaneous/normal group they were different in 64% of cases. When the diagnoses were different, there were more instances in which radiographs were not available.</td>

<td>Review/Other-Dx</td>
<td>52 patients</td>
<td>To investigate the use of a three-phase bone scan for early detection of heterotopic ossification formation and as a method of evaluating Didronel treatment.</td>
<td>There were 23 patients in the series who either showed heterotopic ossification by X-ray on admission or developed heterotopic ossification on follow-up X-rays before beginning Didronel therapy. A three-phase bone scan revealed increased vascularity and accumulation of radioactivity on the bone scan in all areas of ossification on the X-ray and in some areas that did not appear to be involved. The other 29 patients had serial three-phase bone scans, X-ray study, and an alkaline phosphatase determination at approximately 2-week intervals. Didronel treatment was started as soon as the precursor phase of heterotopic ossification was demonstrated on the three-phase bone scan in most of these patients. 9 have not developed ossification that could be seen in X-rays during 3 months of continuing study. 6 patients seen at follow-up during the past year had known heterotopic ossification of 4 to 7 years duration. The three-phase bone scan was used to predict the maturity of heterotopic ossification in these patients. The study indicates that increased vascularity precedes rather than being secondary to heterotopic ossification formation as is suggested in the literature. Didronel treatment appears to be most effective if initiated during this precursor phase.</td>

<td>43. Magee T. Accuracy of 3-T MR arthrography versus conventional 3-T MRI of elbow tendons and ligaments compared with surgery. <em>AJR Am J Roentgenol.</em> 2015;204(1):W70-75.</td>
<td>Observational-Dx</td>
<td>54 patients</td>
<td>To assess the accuracy of 3-T MR arthrography of the elbow vs conventional 3-T MRI of the elbow, compared with surgery.</td>
<td>In 54 patients, the diagnoses made on MRI and MR arthrogram examinations were the same. In 16 patients, MR arthrogram examinations revealed additional findings that were not clearly seen on conventional MRI examinations. There were 6 full-thickness extensor tendon tears, 7 radial collateral ligament tears, and 3 partial-thickness UCL tears seen on MR arthrography that were not well seen on conventional MRI. In 9 patients, MR arthrogram showed ligaments and tendons to be intact that appeared torn on conventional MRI. There were 6 UCLs and 3 common flexor tendons found to be intact on MR arthrography examination that appeared to be torn on conventional MRI. All MR arthrography findings were confirmed at surgery.</td>

<td>Observational-Dx</td>
<td>20 patients and 20 controls</td>
<td>To assess nerve T2 signal and caliber as diagnostic signs at MR neurography in UNE.</td>
<td>Diagnostic performance, as determined with AUC, was excellent for nerve T2 signal to discriminate UNE from a normal finding (AUC = 0.94; 95% CI: 0.87, 1.00) and was excellent for nerve caliber to discriminate severe from mild UNE (AUC = 0.95; 95% CI: 0.85, 1.00). Qualitative assessment demonstrated sensitivity of 83% and specificity of 85% for MR neurography of UNE.</td>

## Reference Study Type | Patients/ Events | Study Objective (Purpose of Study) | Study Results | Study Quality
--- | --- | --- | --- | ---
46. Festa A, Mulieri PJ, Newman JS, Spitz DJ, Leslie BM. Effectiveness of magnetic resonance imaging in detecting partial and complete distal biceps tendon rupture. *J Hand Surg Am.* 2010;35(1):77-83. | Observational-Dx | 22 partial and 24 complete distal biceps tendon ruptures | To evaluate the effectiveness of MRI in diagnosing partial and complete distal biceps tendon ruptures as determined at the time of surgery. | The overall sensitivity and specificity of MRI were 92.4% and 100%, respectively, in detecting distal biceps tendon ruptures. The sensitivity and specificity of MRI for complete tears were 100% and 82.8%, respectively. The sensitivity and specificity of MRI for partial tears were 59.1% and 100%, respectively. | 3

47. Frijlink DW, Brekelmans GJ, Visser LH. Increased nerve vascularization detected by color Doppler sonography in patients with ulnar neuropathy at the elbow indicates axonal damage. *Muscle Nerve.* 2013;47(2):188-193. | Review/Other-Dx | 137 patients with confirmed UNE, 24 patient controls, and 70 healthy controls | To establish the prevalence of increased intraneural vascularization detected by US in patients with UNE and to determine its relationship to clinical, US, and electrodiagnostic findings. | Intraneural vascularization US was found in 21 (15%) of 137 patients with UNE, in 1 (4%) of 24 patient controls, and in 0 of 70 healthy controls (*P*=0.001). Patients with intraneural vascularization US were more likely to have severe weakness (*P*=0.01), severe atrophy of ulnar-innervated muscles (*P*=0.008), axonal damage (*P*=0.001), and more pronounced nerve enlargement (*P*=0.03) than those without intraneural vascularization US. | 4

48. Tagliafico A, Gandolfo N, Michaud J, Perez MM, Palmieri F, Martinoli C. Ultrasound demonstration of distal triceps tendon tears. *Eur J Radiol.* 2012;81(6):1207-1210. | Review/Other-Dx | 8 patients | To describe the role of US in distal triceps tendon tears evaluation. | N = 4 complete tears of the triceps tendon and n = 4 partial tears of the distal triceps involving the lateral/superficial head were identified. Patients with partial tear had a history of a single traumatic event that determined a sudden eccentric contraction of the triceps muscle against resistance. US demonstrated on axial and longitudinal planes a partial tear of the triceps brachii tendon that resulted in a fusiform swelling and retraction of the lateral/superficial head in 4 patients. It was possible to identify the normal insertion of the medial head of the triceps moving the transducer medially. MR and surgical findings were concordant with US findings in every patient. | 4

<td>Review/Other-Dx</td>
<td>3 cadaveric specimens, 30 normal volunteers and 125 patients</td>
<td>To demonstrate normal and abnormal findings of distal brachialis tendon attachment in cadavers, normal volunteers and patients by means of US.</td>
<td>In all cases, US demonstrated the distal brachialis tendon shaped by 2 distinct tendons belonging to the deep head and superficial head of the brachialis muscle. Correlative MRI demonstrated that the brachialis is composed of 2 distinct tendons in 83% of volunteers (25/30). In the patient group, 4 avulsions with bony detachment involving the deep head, 1 delayed onset muscular soreness and 3 tendinous detachments with no bony avulsion involving 1 or 2 tendons were identified. The 4 patients with bony avulsion were immediately referred to the orthopedic surgeon for a presurgical evaluation. Patients without bony avulsion were not referred to the surgeon.</td>

Evidence Table Key

Study Quality Category Definitions

- **Category 1**  The study is well-designed and accounts for common biases.
- **Category 2**  The study is moderately well-designed and accounts for most common biases.
- **Category 3**  There are important study design limitations.
- **Category 4**  The study is not useful as primary evidence. The article may not be a clinical study or the study design is invalid, or conclusions are based on expert consensus. For example:
  a)  the study does not meet the criteria for or is not a hypothesis-based clinical study (e.g., a book chapter or case report or case series description);
  b)  the study may synthesize and draw conclusions about several studies such as a literature review article or book chapter but is not primary evidence;
  c)  the study is an expert opinion or consensus document.
- **M = Meta-analysis**

Abbreviations Key

AUC = Area under the receiver operating characteristic curve
CI = Confidence interval
CT = Computed tomography
FDG-PET = Fluorine-18-2-fluoro-2-deoxy-D-glucose-positron emission tomography
LCL = Lateral collateral ligament
MRI = Magnetic resonance imaging
NPV = Negative predictive value
PPV = Positive predictive value
UCL = Ulnar collateral ligament
UNE = Ulnar neuropathy at the elbow
US = Ultrasound

Dx = Diagnostic
Tx = Treatment
